FINE OUTLOOK FOR JUMBO EXTENSION

DEVELOPMENT WORK CONTIN UES TO EXPOSE LARGE DEPOSITS OF ORE

A new raise has been started in the Jumbo Extension mine, from the south drift on the 1817-foot level, which has reached the farthest point to the south at which te mineralized zone as been exposed. For some distance the drift has continued in quartz and in the large fissure that extends into the shale and which has been penetrated by raises from the 1017 level at several points. The new rulse is being driven for the purpose of reaching the latite hansing wall of the contact channel and determining the width of vein matter here, says the Goldfield Tribune. It is apparent that this drift is coming out in the true shale-latite contact, as the formation in which it is now progressing has all the characteristics of the contact, showing the silicified latite inseperable from the contact formation. As the dip of the shale underlying the fissure is very flat and as the more important deposits of richer ore are invariably found above a wide layer of lower grade, silicified shale or quartzite, it if the shale fold extends to this dis-Innee.
